...Discovering value in natural resource stocks

## Geodex Minerals (GXM-TSXV)

*The following editorial is extracted from the January 2008-2 issue*

**Geodex Minerals** (GXM-TSXV; C\$0.74) reported a resource estimate from its Sisson Brook project in New Brunswick that shows the world-class potential of that molybdenum-tungsten deposit. An extensive drilling program over the past year has demonstrated that the deposit extends well beyond the limits of the resource estimate and also suggested the potential for some higher grade zones. Sisson Brook is ideally suited for mine development, in an active logging area and close to infrastructure. Geodex also holds a property on which Teck Cominco is pursuing high grade indium values and it holds several other exploration properties in that mining-friendly province.

**Geodex Minerals** (GXM-TSXV; C\$0.74) reported assays from the East Flank zone of its Sisson Brook project in New Brunswick, with assays up to 58.5 meters of 0.134% tungsten and 0.131% molybdenum. This new zone was not incorporated into the 381 million pound tungsten and 126 million

pounds molybdenum resource estimate released in November 2007. That estimate will now be updated to incorporate results from the past season's drilling which outlined a couple of new zones that could add substantial size to a deposit that already ranks as world-class. Work, funded by a major, continues at the Mount Pleasant West project to evaluate a zone with high values of indium. The company is exploring other high potential projects in New Brunswick. The current share price doesn't come close to recognizing the value of Sisson Brook, nor the potential of the other projects.

*Price January 30, 2008: C\$0.74*

*Shares Outstanding: 61 million*
